Outlook for 2011-2012 Holiday Season

Updated: December 23, 2011

Temperatures remained a little warmer than normal across South Florida this week, with a similar pattern expected to continue this holiday weekend. A ridge over the western Atlantic, Bahamas and Florida will allow easterly low-level flow to persist, keeping warm temperatures and a slight chance of showers in the forecast through early next week.

A useful tool for looking further ahead in the forecast is the extended 6-10 day outlook issued by the [Climate Prediction Center](#). This outlook calls for a slightly enhanced likelihood of near-normal temperatures and above normal precipitation, December 28th through New Year's Day.

Stay updated with the latest forecasts for south Florida and across the country as we approach the holiday period by going to the NWS Miami website at weather.gov/southflorida and clicking on the map in the front page for a detailed point forecast. You can also get a forecast for another part of the country by typing in a zip code or city and state in the white bar at the top left of the front page.

This outlook will be updated periodically between now and New Year's Day. For the latest holiday outlook, as well as other south Florida weather information including forecasts and warnings, please visit the National Weather Service in Miami website at <http://weather.gov/southflorida>
